Introduction

Every data book (except this one) has "Grid Lines" that are based on the "Golden Rule" of shooting, "One click (minute) will move the strike of the bullet one inch per hundred yards." The rule does not work. The shooter uses the grid lines and over compensates and shoots out the other side. Then he comes back one half the amount. In my book "Sight Alignment, Trigger Control and the Big Lie," I gave the Amended Rule: "The distance from the edge of the TEN line to the center, on any NRA target, is ONE HALF MINUTE at it's given distance." Notice on each page, the grid line at the edge of the ten line is one half minute. I think you'll find that this system will center your shots more quickly. It works!

For years people have been asking me for a data book. Lacking the technical expertise, (A "CAD" program is much like the scientific calculator. One hellava lot smarter than I am). Fortunately Jeff Poquette and Lee Penzkowski approached me with their thoughts on a data book. So it took three Marines to do the job.

I would like to point out some of the features of this data book: 1) It has more than twice the number of plotting pages as most others, 2) The plotting pages are larger, 3) The scoring rings are proportional to the target, 4) The grid lines are from the "Amended" rule, 5) There are Eight sets of wind charts, 6) There is a "Wind speed estimating" guide, 7) There is a chart explaining the rapid fire "Nine-yes, Nine-no" problems, 8) The rapid fire pages have twin bulls for the 1st & 2nd strings, 9) there are pages for the "Gun round count" that helps a gunsmith determine problems, 10) This data book was designed for "Simplicity." Some data books require so much information, there is no time to fill it all in during a match or practice.

Rather than using valuable pages trying to teach the new shooter how to use the book, We choose to place more plotting pages for the more experienced shooter. I will have a video on the use of the data book along with tons of other information for the new shooter. There is just too much information to try to squeeze into this limited space. Our goal was to give you "Exceptional Value." You would have to buy two of the "Other" data books at a greater price and not get as many features.

GOOD SHOOTING.

Jim Owens

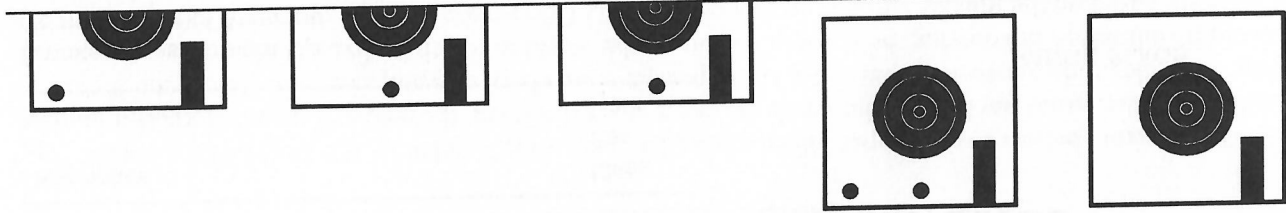

Come-ups

An "Old Timer" shooter gave me a formula for come ups (From 0 to 1,000 yards in increments of 100 yards). The formula is "2-2-3-3-4-4-5-5-6-6." Simply put;

- From the target to 100 yds = 2 min
- From 100 yds to 200 yds = 2 min.
- From 200 yds to 300 yds = 3 min.
- From 300 yds to 400 yds = 3 min.
- From 400 yds to 500 yds = 4 min.
- From 500 yds to 600 yds = 4 min.
- From 600 yds to 700 yds = 5 min.
- From 700 yds to 800 yds = 5 min.
- From 800 yds to 900 yds = 6 min.
- From 900 yds to 1,000 yds = 6 min.

Look at the numbers from 600 yds to 1,000 yds, they add up to 22 mins., that's the same numbers we used 35 years ago. Remember "Normal Come Ups" are to get you on paper, you need to adjust to the center once you are on paper.

WIND SPEED ESTIMATING GUIDE

Description	Miles Per Hour	Direction of wind shown by smoke. Tree leaves barely move.	1 - 3	4 - 7	8 - 12	13 - 18	19 - 24	25 - 31	32 - 38
Smoke raises Straight Up									
No movement of Anything									
Natural Effects									
of									
Walking is affected.									
Whole trees are in motion.									
Wind begins to whistle.									
Large branches in constant motion.									
Dust clouds.									
Large branches and small trees sway.									
Small branches are moved. Loose paper and dust are blown along.									
Loose bits of paper are lifted and ruffled.									
Leaves and twigs are moving.									
Leaves rustle slightly.									
Wind felt on face.									

RANGE FLAGS

Wind Charts "Disclaimer"

The true "Technocrat" believes with proper information (the exact muzzle velocity, the length of the barrel, weight of the bullet, the exact miles per hour of the wind, the exact clock direction, the ambient temperature, the barometric pressure, the elevation above sea level and a 100% perfect wind chart) can place his first shot in the X-ring every time. I would be interested in knowing the color of the sky in the world in which he lives.

Wind charts are based on the muzzle velocity in feet per second. One person makes a chart at 2900 FPS which could be a very hot load (and possibly dangerous). While another person makes a chart based on 2700 FPS and it would be considered a very mild load. The number of clicks between the two could place the shot nearly off the target at 600 yards.

Combine that with the large number of bullet weights, BC's, individual hand loads, molyed vs. non-molyed, the individuals inability to determine an EXACT speed and/or direction, you can see why I have shied away from making a .223 wind chart.

Given the facts that: a) a lot of people have asked me for a .223 chart and b) No one has ever accused me of being smart (and they are not going to start now), I have placed several .223 charts in this data book.

I have for years, used my .308 cal. 168 gr. Sierra wind charts for both my .223 AND my 300 Win. Mag. Rifles. I simply gave them a fudge factor up or down as required. Other Masters and High Masters have done the same thing. It works. It may only get close and is not 100% accurate, but given all the factors, neither are the other charts. I applied a percentage to each .308 value for each of the .223 bullet weights and checked it against other wind charts. I use it and it works for me. If you don't like it you are free to use someone else's chart. What a country.

All the 1/2 minute charts are in one color and all the 1/4 minute charts are in another color. If you use one data book for each type of rifle you shoot (like you should), then tear out the wind charts that you do not need. You would not want to use the wrong set of charts during a match.

Most of the charts, I feel are pretty dang good. However, the 69 gr. Sierra chart does not give me my warm fuzzy feeling. If you think it or any of the other charts are too much or too little, please feel free to call me at 414-769-9862 and let me know. I will have them checked out and if you are right I will have them corrected in future printings. Keep in mind a wind chart is a tool. It will help in getting you close, but will not put it in the X-ring every time. Enjoy the wonderful blue sky.

Smoke raises Straight Up
No movement of Anything
Direction of wind shown by smoke
Tree leaves barely move
Wind felt on face/Leaves rustle slightly
Leaves & twigs are moving
Loose bits of paper are lifted & ruffled
Small branches are moved.
Loose paper & dust are blown along
Large branches in constant motion
